Dust Suppression

The Problem:

The Costain team at C336 were faced with the challenge of carrying out excavations and earth moving activities on a narrow site adjacent to London Underground and Network Rail lines into Paddington Station whilst keeping dust emissions to a minimum.

The Solution:

Their solution was to use a Dehaco De Dust 75 (DD75) “all in one” unit to dampen down the ground surface. The DD75 is equipped with its own generator and a 2000 litre water bowser, which lasts just over an hour. It is on a site towable trailer, so it is easy to manoeuvre it into the best position on site.

It comes with a 340 degree oscillating head and can throw water up to 40 metres.
