## Magnetic LED lights

BFK have introduced magnetic LED strobe lights for use during lifting operations throughout the twilight and night time hours. The LED lights can be attached to any metal object being lifted at night creating a clear visual beacon during late night lifts.

Following an incident at the Bond Street SCL site all lighting on BFK SCL sites was reviewed. Although it was agreed that in all cases, lighting on site during the night shifts was sufficient it was decided that improvements could be made to highlight the loads being lifted by the crane during the twilight and night time hours.

When in use the LED lights can be seen across site. As well as being hardwearing, long lasting and fitted with a strong magnet to ensure there is no chance the lights detach themselves during use, the lights can also generate a number of different strobe effects which can be used to differentiate between different loads being lifted.

RAC LED Magnetic Warning Light

Since the LED lights have been introduced BFK has not had a single skip related incident occur during the late evenings and night shifts.
